

# What would we make next?

## F1 / Preparation

Synthetic practice data. 50 raw rows, 48 unique records, two exact duplicate rows removed. Two missing confidence-after values and one missing time estimate remain missing after deduplication.

## F2 / Requested next tasks

Lesson planning: 16. Feedback: 10. Visual resources: 8. Communication: 6. Research: 4. Data analysis: 4. Counts sum to 48.

## F3 / Access barriers

Time to learn: 18. Account access: 12. Board guidance: 10. Usage limits: 8. Counts sum to 48.

## F4 / Confidence values

Mean before across all 48 records: 2.938. Mean after across 46 valid records: 3.304. Mean paired change across 46 complete pairs: 0.326. The unpaired means use different records.

## F5 / A supported takeaway

Lesson planning is the most frequently requested next task in this fictional file: 16 of 48 unique responses. That is a description of this practice file, not a finding about real educators.

## F6 / A useful limitation

The data are invented self-reports. They cannot establish an effect on learning, measured time savings or a representative pattern among Ontario educators.
